

Suggestions for Using DMSO as a Carrier for MMS

DMSO has been used since 1950 by doctors as a carrier that enables various drugs or chemicals to be rubbed into the skin and into muscles. Blood flowing through muscle picks up the drug or chemical which then circulates in the liquid of the blood – the plasma. DMSO is the official name for Dimethylsulfoxide. It is available in some drug stores and can be ordered on the Internet. A suggested plan for use when fighting various difficult diseases follows below.

Dr. Kehr, a scientist in Utah first posted the concept of activating 8 to 10 drops MMS and then adding DMSO to it for penetration through the skin. When the need arises to push MMS into the body without drinking it, then this mixture can simply be vigorously rubbed on the skin with bare hands. The MMS that produces the ClO₂ gas would move through skin into muscles and further into blood plasma. A number of MMS users have tried this strategy with success. DMSO can be purchased [[Here](#)] for example.

You can review the web site at <http://new-cancer-treatments.org/Cancer/OCC.html> to learn how this strategy can be used by people who are fighting cancer. In its latest update, the site has become more complex with detailed explanations of how cancer cells can be restored back to normal cells – in large part by using the MMS/DMSO mix. It is good reading for clinic owners and others who may find reassurance that this is not just a theoretical idea.

Some MMS users, however, have difficult, life-threatening diseases (not cancerous). Some of these people encounter a “nausea barrier” even at the 4 or 5 MMS drop level. Due to weakened immune systems, or weakened liver functions, or weakened kidney functions, they are can't go higher in MMS doses. They might wish to take MMS doses every two hours with stronger doses but temporarily cannot because of nausea.

It appears however, that with DMSO additional ClO₂ gas can be introduced – more than just the swallowed doses, because the DMSO/MMS mixture, when rubbed onto large leg or arm muscles, kills more pathogens and does it faster because the plasma circulates the ClO₂ gas in a different way. Volunteers should report back on this point. At least this appears to be true. Users who are in a hurry to ramp up should continue at the highest oral dose they can achieve AND IN ADDITION they can rub DMSO/MMS onto skin and large muscles thus augmenting and speeding the killing of viruses, tumors, and pathogens. If bad nausea occurs then the oral and the DMSO/MMS levels must be lowered to stay just under the nausea barrier. See the article at <http://mms-articles.com/>.

FOR PEOPLE WITH DIFFICULT DISEASES (Shingles, Herpes, HIV, “Morgellons,” Hepatitis, leprosy...)

1. Prepare a normal mix of 8 MMS drops activated with 40 drops of citric acid or fresh lemon juice. Swirl and wait three minutes for the activation to occur.
2. Add ½ teaspoon of DMSO and three to four teaspoons of distilled water.
3. If you are dealing with cancer, then you must use the schedule recommended by Dr. Kehr at the web site above. Plan your commitment to the 5-day schedule he has designed.
4. Avoid use of colloidal silver before and during these treatments because the MMS will be spent and wasted in eliminating the heavy metal (silver) which will be found throughout the body.
5. If you're not dealing with cancer then you can simply lift the MMS/DMSO out of the dish and vigorously rub it onto the skin with bare hands. While the large leg muscles and arm muscles are good places to rub, most people report that fluid is left over so they rub it on the neck, back, and elsewhere until it is all used.
6. This process can be repeated. Allow two hours or more to separate the applications. Watch for signs of nausea and reduce the MMS doses if it appears. Read the article about avoiding nausea at <http://MMS-articles.com> Avoid vitamin “C” and anti-oxidants the entire day(s) of these treatments.
